Hiring Manager

THE ICONIC · Graduate Program
Sydney, NSW, Australia

Dear Hiring Manager,

I am writing to apply for the Graduate E-commerce Operations Analyst role within THE ICONIC's Graduate Program. As a second-year Bachelor of Business Administration student at Macquarie University and the digital operations and AI automation lead for a Thai retail family business, I am drawn to THE ICONIC because pure-play, multi-channel e-commerce operations is exactly the work I do every day at smaller scale, coordinating stock, automation, and process improvement across six online channels and physical retail. Below, I address the selection criterion on identifying and implementing ongoing process improvements.

IDENTIFICATION AND IMPLEMENTATION OF ONGOING PROCESS IMPROVEMENTS

Since February 2025, I have led digital operations, AI automation, and stock coordination for CHAN NEUNG, a Thai premium fruit brand (fresh and dried Marian plum and seasonal fruits) operating across 20-plus Bangkok mall branches and six online channels, including responsibility for our Bangkok urban branch and orchard supplier relationships.

In early 2026, I noticed a recurring pattern at the Bangkok urban branch: stock was sitting longer than usual, complaints were rising, and weekly sell-through was declining. Rather than treating each symptom in isolation, I traced the issue upstream. One orchard supplier was shipping product that did not meet our spec, and the inconsistency was visibly different from product sourced through our other partners. The problem was not the branch; it was in our sourcing process.

I implemented two changes. First, I redistributed stock from our other branches to refill the urban branch immediately, so staff could keep serving customers without interruption. Second, I cancelled all outstanding orders from the under-performing orchard and consolidated future sourcing through suppliers who consistently met our quality standard. To prevent recurrence, I introduced a short incoming-quality checklist that branch staff complete before accepting deliveries.

Sell-through and customer feedback at the Bangkok urban branch have improved meaningfully since, and I continue to monitor and adjust the process. The experience taught me that the most effective improvement is the one that fixes the upstream cause, not the visible symptom, and that improvement is rarely a one-off fix.

ENGAGEMENT WITH MQBS2010

In the Week 4 lecture, I learned to diagnose workplace problems using the MECE principle (mutually exclusive, collectively exhaustive) and to break them into issue trees. In the Week 4 tutorial, I practised this by drafting an issue tree on the WIL simulation and prioritising issues with an effort-versus-impact matrix. The tutorial then introduced Kolb's (1984) experiential learning cycle, which now structures how I review and refine ongoing process improvements at CHAN NEUNG.

I would welcome the opportunity to contribute this experience to THE ICONIC's graduate program.

Yours sincerely,

Chananin Klainin
