HIRING MANAGER

THE ICONIC · Graduate Program
Sydney, NSW, Australia

Dear Hiring Manager,

I am writing to apply for the Graduate E-commerce Operations Analyst role within THE ICONIC's Graduate Program. Pure-play multi-channel e-commerce is the work I already do at smaller scale at my family's Thai retail brand. Below I address the selection criterion on identifying and implementing ongoing process improvements.

01 IDENTIFICATION AND IMPLEMENTATION OF ONGOING PROCESS IMPROVEMENTS

Since February 2025, I have led digital operations, AI automation, and stock coordination for CHAN NEUNG, a Thai premium fruit brand (fresh and dried Marian plum and seasonal fruits) operating across 20-plus Bangkok mall branches and six online channels, including responsibility for our Bangkok urban branch and orchard supplier relationships.

In early 2026, I noticed a recurring pattern at the Bangkok urban branch: stock was sitting longer than usual, complaints were rising, and weekly sell-through was declining. Rather than treating each symptom in isolation, I traced the issue upstream. One orchard supplier was shipping product that did not meet our spec, and the inconsistency was visibly different from product sourced through our other partners. The problem was not the branch; it was in our sourcing process.

I made three concrete changes. First, I redistributed stock from our other branches to refill the urban branch right away, so staff could keep serving customers without a gap. Second, I cancelled the outstanding orders from the under-performing orchard and consolidated future sourcing through the suppliers who consistently met our quality standard. Third, to stop the issue happening again, I introduced a short incoming-quality checklist that branch staff complete before accepting deliveries.

Sell-through and customer feedback at the Bangkok urban branch have improved meaningfully since, and I continue to monitor and adjust the process.

The most effective improvement is the one that fixes the upstream cause, not the visible symptom, and that improvement is rarely a one-off fix.

02 ENGAGEMENT WITH MQBS2010

Week 4 taught me to diagnose workplace problems with MECE (mutually exclusive, collectively exhaustive) and issue trees. In the tutorial I practised this on the WIL simulation, prioritising with an effort versus impact matrix. The tutorial then introduced Kolb's (1984) experiential learning cycle, which now sits behind how I review process improvements at CHAN NEUNG.

I'd be glad to bring this work into THE ICONIC's graduate program. Thank you for considering my application.

Yours sincerely,

Chananin Klainin
